

Query

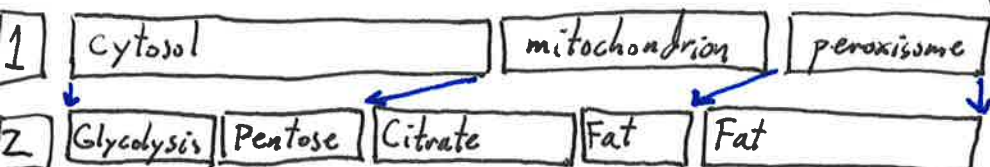

- Determines ^{which} attribute sets and hence which entities the selection includes.

Horizontal dimension of bars for sets represents the proportion of the total set considering entire hierarchy.

Draw lines to clarify hierarchy if they do not align as a result of the proportion.

Alternatively, clarify hierarchy with color-coding.

Or... do not collapse the sub-set detail for each step.

Aggregate

- Does not change which ~~and~~ attribute sets and which entities the selection includes.
- Determines which attributes segregate the aggregate sets.
- Follows same hierarchy from Query.
